Market Volumes and Values

The Day Ahead Market is, by far, the largest market in the SEM, circa 80-85% of all transactions are cleared in this market. The distribution of volumes across the SEM markets have been broadly constant since the introduction of these trading arrangements in October 2018.

Generally, in power markets, market participants will prefer to lock their positions well ahead of delivery time given the increased volatility in prices closer to real time.

Another important factor is associated with the TSO dispatch arrangements. The vast majority of wind generation in the SEM is cleared at the Day Ahead stage. That might also explain to some extent the additional volumes cleared in this market.

SEM-GB Price Differential

The charts show that the SEM and GB prices appear to follow the same general trend. Significant spreads can be observed on several occasions. The MMU has investigated the underlying reasons for these spreads and the findings are consistent with those discussed with the SEMC previously.

Basically, the periods of significant spreads between the two markets are generally correlated with period of very low wind. Due to the prevailing fuel mix across both regions, the effects of low wind are felt more intensively in the SEM than in GB. The MMU is investigating this matter further and will come back to the SEMC in the foreseeable future with more information on this front.

SEM Interconnectors November 2024

Events of capacity curtailment (by the SEM TSO) in the direction SEM to GB.

Moyle
8th 17:13 -20:00

EWIC
30th 08:00 -23:59

Interconnector Flows

In November, the SEM Interconnectors mostly imported power from GB, with only minimal exports. This reflects the predominantly higher prices in the SEM compared with GB.

There were number of periods in November when Moyle was not fully exporting due to lower volumes traded in IDA1 and IDA2 markets.

Balancing Market November 2024

Where power stations are run differently from the market schedule, it is termed "constraint". Subject to the Trading and Settlement Code and Firm Access, Constraint payments keep generators financially neutral for the difference between the market schedule and what actually happened when generating units were dispatched.

Generators can be constrained 'on' or 'up' if the market schedule indicated they were to be run at lower levels than actually happened. Or they could be constrained 'down' or 'off' if they were to be run at a higher level than happened in reality. There is always an overall net cost to the system associated with constraints.

Imperfection Costs - Forecast vs Actual

Determinant Name	Value €
CABBPO	138,942.38
CAOOPO	-525,802.57
CCURL	-713,533.60

30 Minutes Imbalance Price

€145.28

Average Price

€69.85

Lowest Price

€495.05

Highest Price

Imbalance Price & Volumes

The average Imbalance (BM) Price this month is lower than the Day Ahead Price. Additionally, the Balancing Market prices has exhibited a much higher range of prices indicating a higher level of volatility compared to Day Ahead Market Prices. This is an expected characteristic of the Balancing Market.

There were no Reliability Options events this month as the Balancing Market prices have not breached the PSTR level.

Monthly Average Hourly Demand Curves

SEM Demand

The graph illustrates a steady demand within NI, with only increase of 1.57% compared to the corresponding period in the previous year.

The demand for ROI during the month has shown an increase of 4.93% relative to the same period last year.

Demand in the SEM as a whole is up by 4.34% compared to the same period last year.

Duration Curves November 2024

Price Duration

The price duration curve shows the hourly DAM prices across the month ordered from the largest to the smallest.

Residual Duration

The residual demand curve shows the ordered hourly demand level across the month which can't be met by renewable generation.

Price against Residual Duration

Shows the residual duration for each period relative to the DAM price for that period.

Average Flows N-S Tie Line Long Term Trend

North South Tie Line Volumes 15 minute periods

North South Tie Line

Flows across the N-S Tie Line were predominantly in the North to South direction this month. This has been the long term trend. There are persistence reasons for this trend.

- When the wind penetration is high in NI, a surplus of power can be formed as the TSO must run a minimal number of thermal units in NI to deal with operational constraints in the system. Exporting power southwards is a mechanism to avoid wind curtailment.

- The Moyle Interconnector, due to it's lower physical losses, is allocated first for flows in the GB to NI direction. Similar to what happens when the wind penetration is high or demand is low, the interconnector flows compete with the system constraints. In order to not curtail the interconnection capacity with GB, power flows are directed southwards.

- Finally, the demand in ROI has been growing at a faster pace than in NI.

Wind Generation November 2024

Average Daily Actual Wind (MW)
1,448

Average Daily Forecast Wind (MW)
1,560

Min SNSP%
11.14

Max SNSP%
75.32

Actual Daily Average Wind Relative to Forecast Daily Average Wind

Wind Generation

Wind generation decreased 13% compared to previous month and 20% from the same period last year.

SNSP

SNSP is closely linked to wind generation and as such follows the same trend across the month.

CO₂ November 2024

CO₂ Intensity (gCO₂/kWh)

CO₂ Intensity

CO₂ Emissions

CO₂ Intensity

CO₂ Intensity i.e. how many grams of carbon are emitted for every unit of electricity used, should be negatively correlated with the volume of wind output on the system.

CO₂ Emissions

CO₂ emissions i.e. the estimated total CO₂ emissions from all large power stations, follows the same trends as CO₂ intensity levels over the course of the month.

Fuel Costs and Spreads

Gas Price November 2024

111.00
Monthly Average (p/therm)
96.25
Monthly Low (p/therm)
121.20
Monthly High (p/therm)

Monthly Day Ahead NBP Gas Price by Year (p/therm)

Gas Prices

Gas prices have experienced further increase of 12% compared to the previous month, increasing from 99.04p to 111p.

The market is expected to remain volatile, with potential impacts from weather conditions and geopolitical developments affecting the supply and demand dynamic.

Gas Forward Prices

Gas Forward Prices

Forward curves increased further due to potential supply issues as the Russian Transit agreement concludes at the end of the year.

Coal Price November 2024

Coal Prices Per Tonne
\$120.84
Monthly Average
\$117.20
Monthly Low
\$122.75
Monthly High

Coal Prices

Coal prices were a bit higher compared to the previous month at \$120.84/tonne (1% increase from the last month).

Coal Forward Prices

Coal forward prices demonstrate a decrease at the end of the month.

Carbon Price November 2024

EU Carbon Prices (€/tonne)

€7.15
Monthly Average
€3.58
Monthly Low
€70.39
Monthly High

UK Carbon Prices (€/tonne)

€45.28
Monthly Average
€43.07
Monthly Low
€47.01
Monthly High

Monthly EU Carbon Permits Price by Year (€/tonne)

UK & EU Carbon Prices

Carbon Prices

Carbon has increased relative to the previous month by 6%.

EU emission allowance prices have been trading lower for much of this year, alongside gas and power. We believe this pressure is likely to persist. EUA prices have been weighed down by a combination of bearish factors, including a sluggish industrial recovery, strong renewables output and limited power demand from mild weather. This does not seem to be the case for November.

Spark Spreads November 2024

Clean Dark Spread measure the profitability of coal fired power generation based on the variable cost of inputs (coal and carbon credits) and the value of the output (electricity).

Clean Spark Spread is the difference between the price received by a generator for electricity produced and the cost of the natural gas + Carbon needed to produce that electricity.

Clean Dark Spread v Clean Spark Spread

Clean Dark Spread v Clean Spark Spread (October 2018 Onwards)

Clean Dark Spread vs Clean Spark Spread

Gas was still more profitable than coal for the duration of the month even after a massive increase in the gas price. The spread between them was generally consistent across the month.

Clean Spark Spread was generally positive with a decrease on 24th Nov when the wind increased for a sustained period.
