

Hi Sarah

Further to our phone conversation earlier today I confirm that as someone in the middle of connecting a 90 kw generator I have a question about the connection charges for embedded generators in the medium term.

I specifically refer to the speculation that there will be a reduction in the grid connection charges for future embedded generators arising from the ongoing *connection charges consultation*. My concern is what mechanism will be available to those parties, like myself that have already paid for what in effect will be substantially higher grid connection fees , to clawback the significant cost differences.

I feel that the overwhelming demand for future generator connections has precipitated this review and that the *earlier movers* and the extra financing associated with their connections should not be overlooked in any new pricing agreement.

Yours sincerely

Paul Kelly
