

Technical journals and popular press have been full of discussion and debate about green hydrogen with many commentators concluding that we will face energy shortages along the decarbonisation pathway without it.

I am curious as to why UREGNI has included biomethane in its work program, which will only ever provide marginal contributions to emission reductions, but omitted green hydrogen that can significantly help solve wind farm curtailment through the Power-to-X and Power-to-Gas models.

Kind Regards
David Surplus OBE
